

Our good neighbour policy

We only build wind projects where we can be certain they will be good neighbours. This means ensuring that there will be no noise or shadow flicker problems for people living nearby and no problems for local wildlife. Our belief is that if wind energy is to succeed it needs to be sustainable in all senses of the word.

Expertise and technology

To deliver on our good neighbour policy we have a dedicated team of experts, planners and wind engineers to ensure good design and implementation. We also use the best wind turbine technology money can buy - and always have.

Our machines have no gearbox and operate at different speeds according to the prevailing wind speed. These unique features allow for virtually silent operation and the most aesthetic windmills in the UK today.

Taking responsibility

We design and build our wind parks to operate for 30 years. Once they are built we're still here, operating and maintaining them ourselves and ensuring they deliver on our promises to our neighbours.

We take full responsibility for the life time of our projects. We're just a phone call away.

Experience and success

We have had wind parks operating the length and breadth of the country for the last ten years - the proof of what we're saying here is plain to see. Each one of our projects has delivered on our good neighbour promise - something we take immense pride in.

Ethical company

Ecotricity exists to bring about environmental improvement through changing the way electricity is made and used in the UK, this goal is at the heart of the company and the root of all the things we do.
